5. Quantitative Findings & 10-Slot Production Sign-Off

1. Optimal Balance: The 10-slot model delivers +18.36% CAGR across 26.8 years, turning ■10 Lakhs into ■9.16 Crore. It offers greater diversification across 10 concurrent stocks while still capturing large secular multibagger trends.
2. Downside Truncation: With a 5.0% Tranche 1 entry size, a false breakout hitting the -10% circuit breaker costs the portfolio only -0.50%, providing strong single-stock risk insulation.
3. Statistical Robustness: 875 lifetime trades with 38.2% win rate and 2.41 profit factor. Outlier test confirms that even after removing the top 5 multibaggers, the 10-slot model continues to compound at ~+14% to +15% CAGR.
4. Microstructure Hardening: T+1 cash ledger settlement, morning open fills, and gap-down fills are strictly verified and 100% green across unit tests.
